

# Reduction of Physical Losses

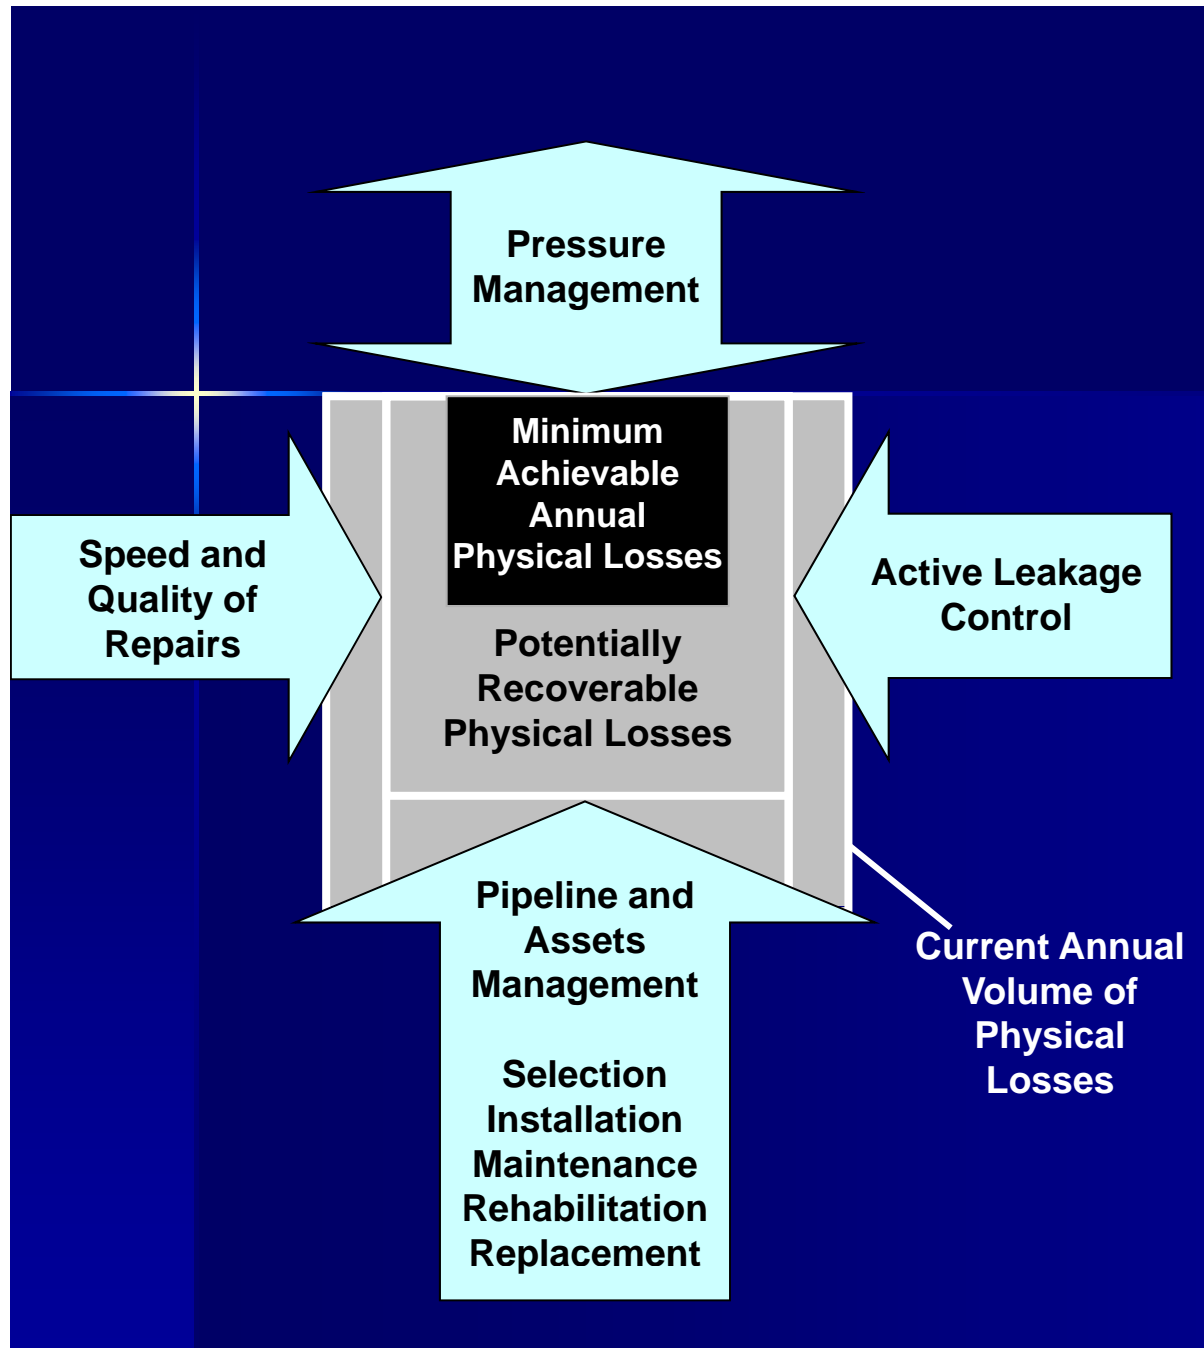

Non-Revenue Water Management Training  
DMCI Homes Corporate Center, Nov 18-19, 2010

# Content

- 💧 **The four key elements of a leakage reduction strategy**
- 💧 **The leakage reduction check list**
- 💧 **How to get started?**
- 💧 **Conclusions**

# The 4 Elements of a Sustainable Leakage Control Strategy

# A Challenge for Many Utilities: Move from Passive to Active Mode!

## 💧 Three levels of sophistication

- **Doing the obvious (simple and cheap):** Identifying, locating and repairing visible leaks
- **Second level of action:** Localizing and repairing non-visible leaks (listening devices)
- **Third, the advanced and sustainable stage:** Establishing district metered areas (DMAs) and introducing pressure management

# The Physical Loss Reduction Checklist

- 💧 **Change Management Focus**
- 💧 **Improve speed and quality of repairs**
- 💧 **Introduce active leakage control**
- 💧 **Review, improve operating practices**
- 💧 **Introduce network zoning and DMAs**
- 💧 **Practice pressure management**
- 💧 **Apply good asset management**

# Changing Management Focus

- 💧 **Often, leakage reduction ignored or not taken seriously:**
  - **misconceptions: it's a one time, technical effort!!!**
  - **non prestigious, invisible work**
  - **politically sensitive; digging up streets**
  - **limited management attention**
- 💧 **level of effort underestimated**
  - **manpower intensive, often night work**
  - **Insufficient allocation of vehicles, tools and equipment**
  - **under-funding**
  - **job can't be done in 'spare time'**

# Changing Management Focus, ctd

- 💧 **Management to understand and accept challenge**
- 💧 **Ownership, commitment and leadership by management**
- 💧 **Supporting elements/conditions:**
  - enabling environment -- politicians, customers on board
  - mandate, empowerment, capacity
  - objectives, targets
  - organization and administration
  - financial resources, budget,
  - communication inside and outside of the utility
  - incentives for staff

# Improving Speed and Quality of Repairs

- 💧 Clear repair policy and procedures
- 💧 Efficient organization from call through repair
- 💧 Availability of equipment and materials
- 💧 Sufficient funding
- 💧 Appropriate standards, specs for materials and workmanship
- 💧 Committed management and staff
- 💧 Outsourcing
- 💧 Repair supervision

# Time is of the Essence – How Quickly do You Repair a Small Leak?

# Quality of Repairs

- 💧 Too often leaks are repaired at sub-standard quality -- with sub-standard materials
  - wrapped-around plastic bags (or pieces from rubber tubes of tires)
  - wooden plugs
  - sub-standard, non-stainless steel repair clamps

# Quality of Service Connections

- 💧 Service connection is the weakest part of the system
- 💧 A leaking service connection (e.g. corroded GMS pipe) should be entirely replaced and not repaired
- 💧 PVC is **not** an appropriate material for service connections (better use HDPE, copper, stainless steel, ...)
- 💧 High quality pipe saddles and fittings are the most cost effective long term solution due lower life cycle costs

# Remember: Leakage Classification

- 💧 **Reported Bursts**
  - visible, often phoned in by public
- 💧 **Unreported Bursts**
  - non-visible, located through leak detection survey
- 💧 **Background Leakage**
  - very small; difficult and uneconomic to detect and repair individually
- 💧 **Most leaks do **NOT** come to the surface, are mainly caused by leaking service connections**

# **First and Immediate Challenge: Fix the Visible Leaks!**

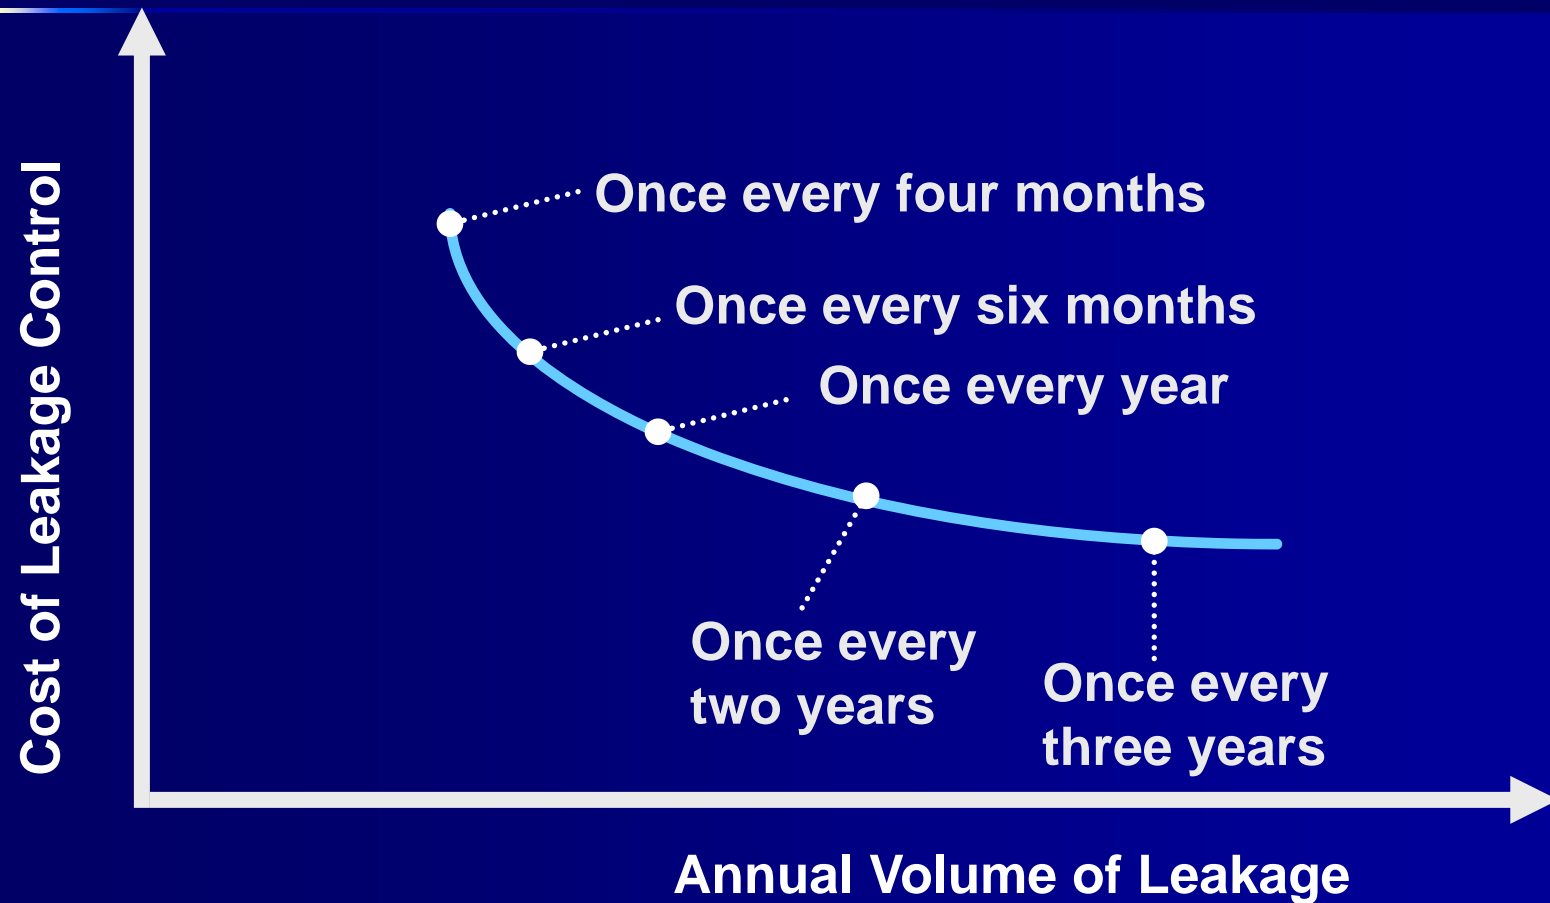

- 💧 **Detecting, reporting visible leaks:**
  - public vigilance, telephone hot line
  - meter readers looking out for signs of leaks
  - routine inspection of the system
- 💧 **These measures are simple, obvious, inexpensive, but need:**
  - technical capacity, organization, standards, procedures, sustained commitment
- 💧 **Outsourcing of repair an attractive option**

# Locating Non-visible Leaks

- 💧 Routine program for finding and locating leaks
- 💧 Many techniques and instruments in use:
  - Listening sticks
  - Ground microphone
  - Leak noise correlator
  - Noise Loggers

# How Often Should you do Leak Detection?

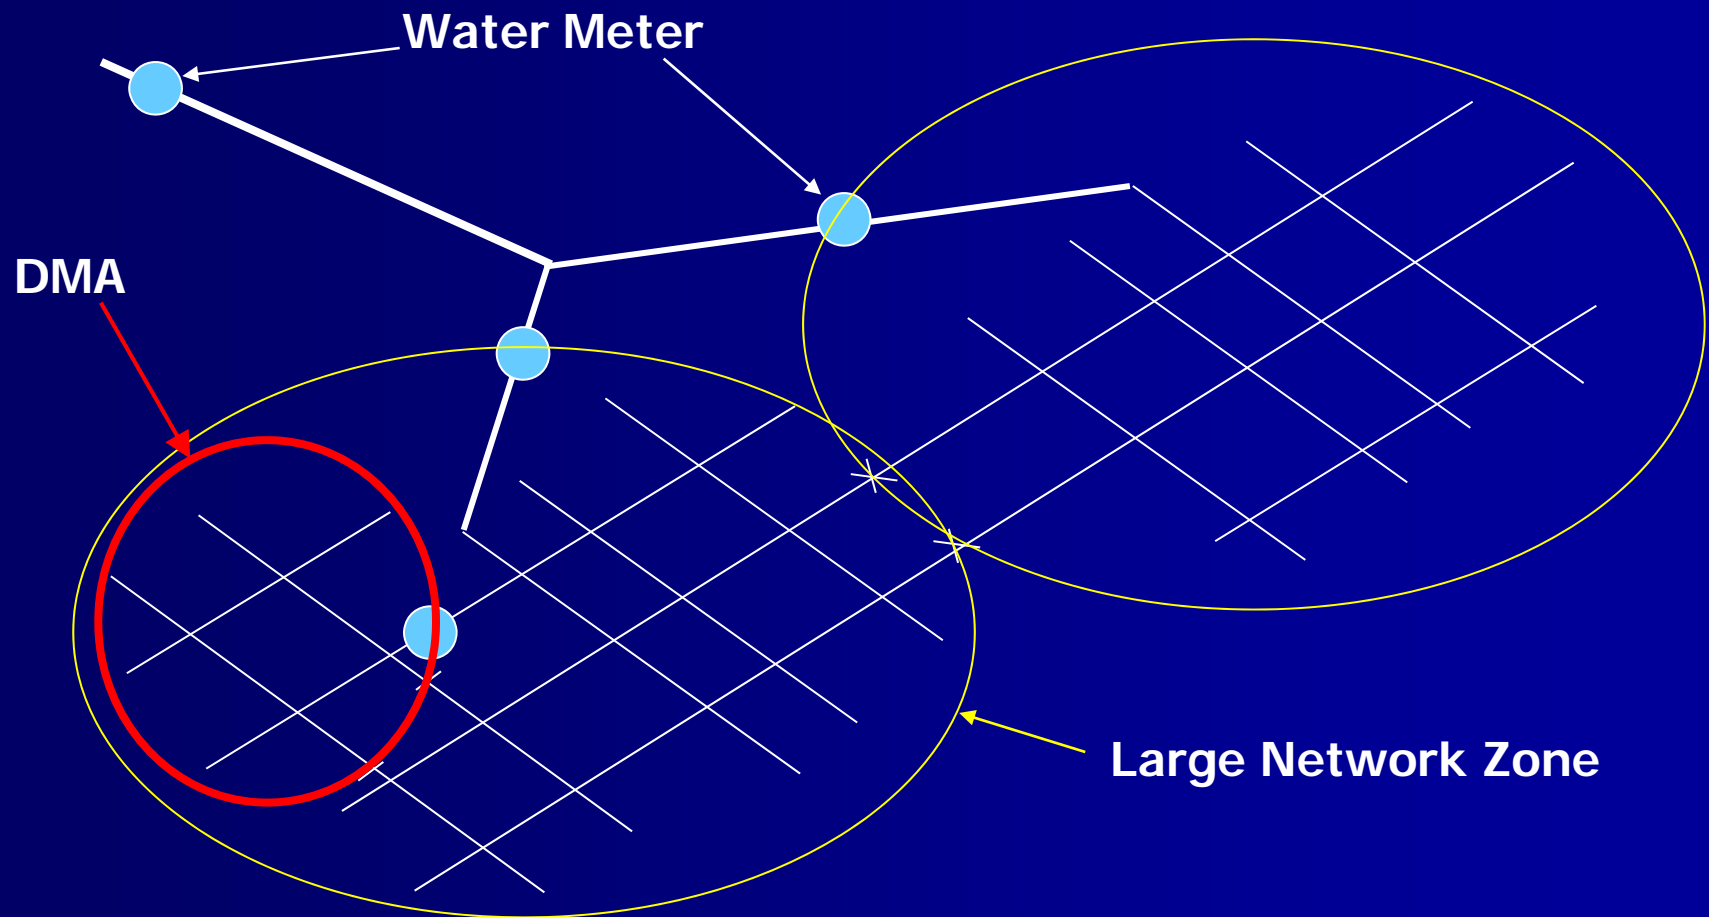

# Reviewing and Improving O&M Practices

- 💧 **Avoid wide pressure fluctuations**
- 💧 **Intermittent supply: try to (re)establish 24/7 supply in some areas**
- 💧 **Inspect and maintain valves and hydrants regularly**
- 💧 **Operate reservoirs and pumping stations properly**
- 💧 **Keep network drawings or a GIS continuously up to date**

# Network Zones and District Meter Areas

# DMA – District Meter Area

## 💧 Principles of DMA approach

- division of network into small hydraulically discrete zones
- continuous measurement of flow and pressure

## 💧 Objectives

- Reduction of leak awareness time
- Prioritization of leak detection activities

## 💧 An excellent basis for pressure management

## 💧 The way forward for utilities with poor quality networks

# Designing, Establishing DMAs

- 💧 **Based on hydraulic network analysis**
- 💧 **Design criteria:**
  - **one inflow point only (if at all possible)**
  - **size: between 500 and 3,000 service connections**
  - **variations in ground level to be considered**
- 💧 **Isolate zone through the installation of boundary valves**
- 💧 **Install devices for inflow and pressure measurement**

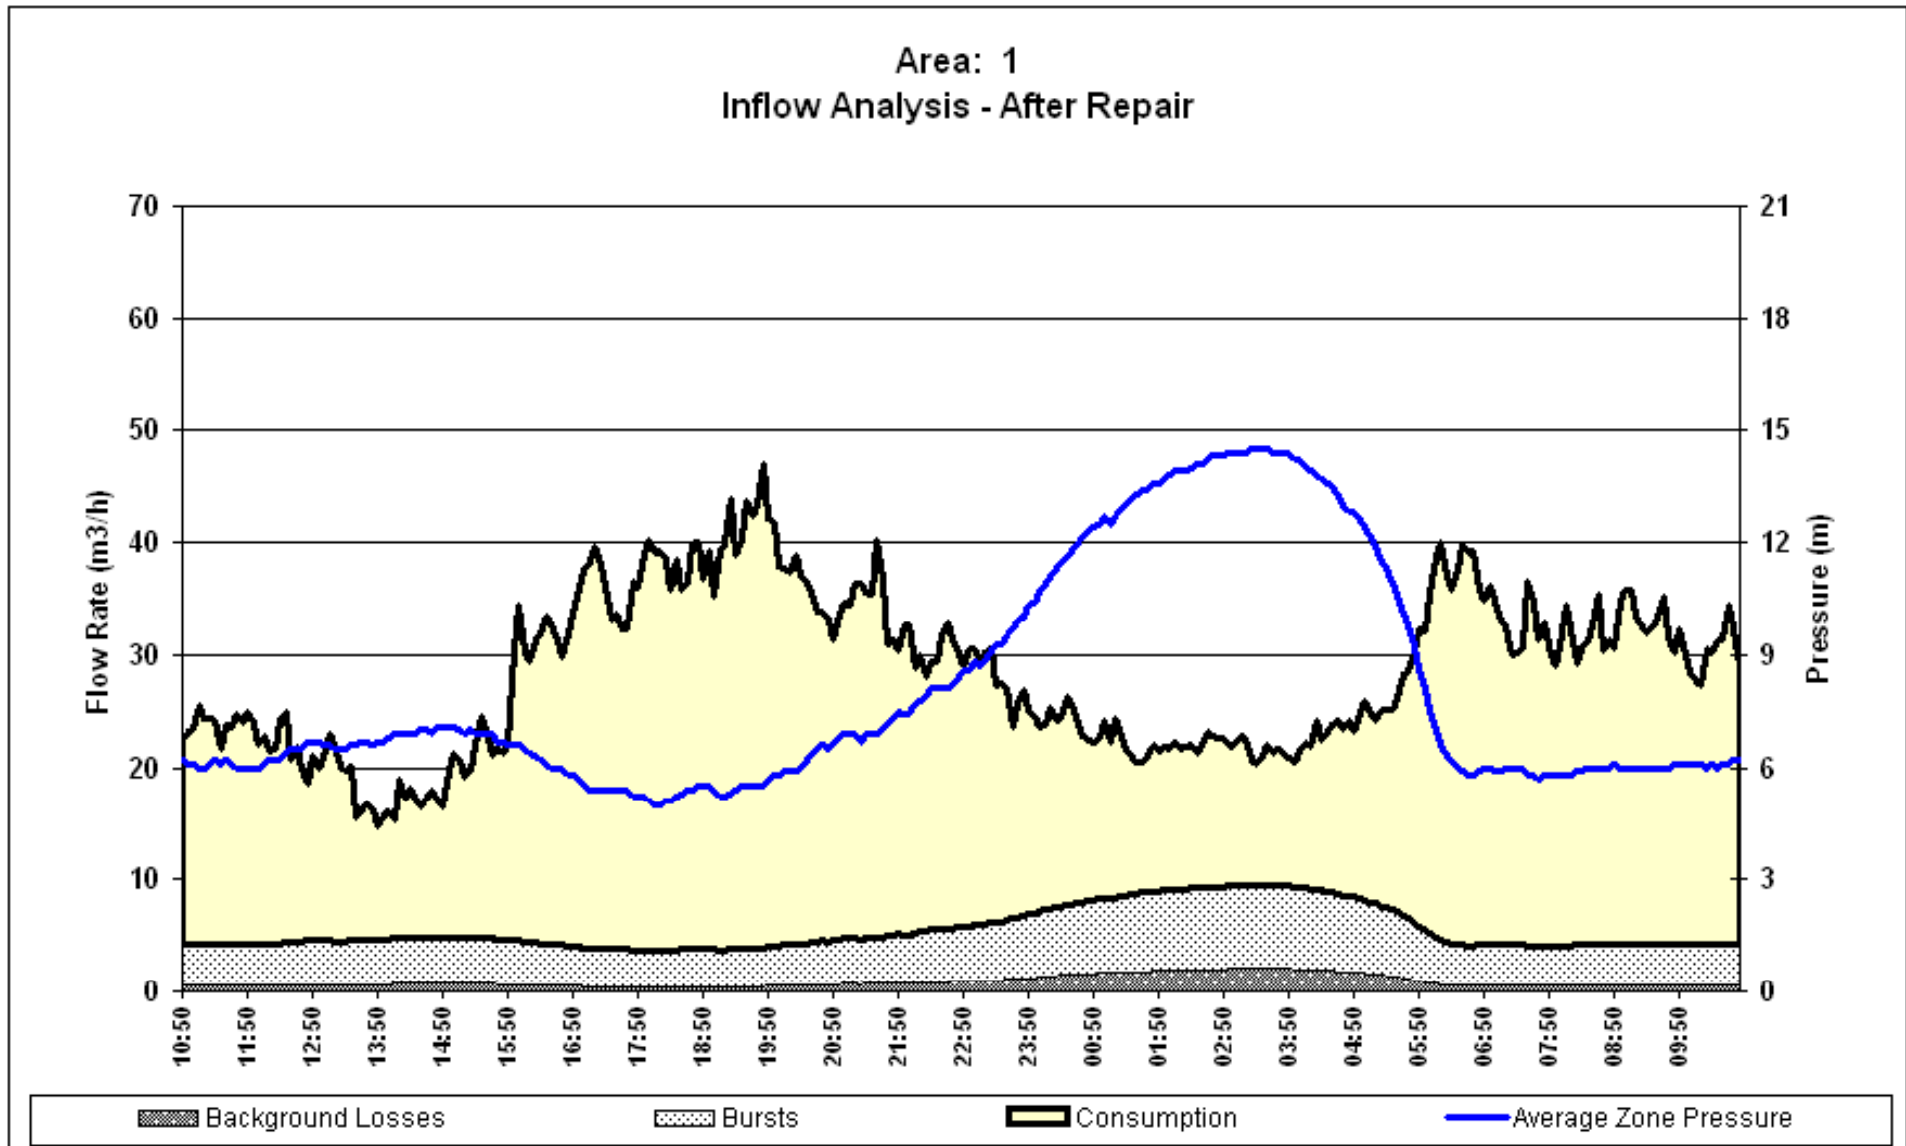

# Data Analysis

## Before Leak Detection and Repair

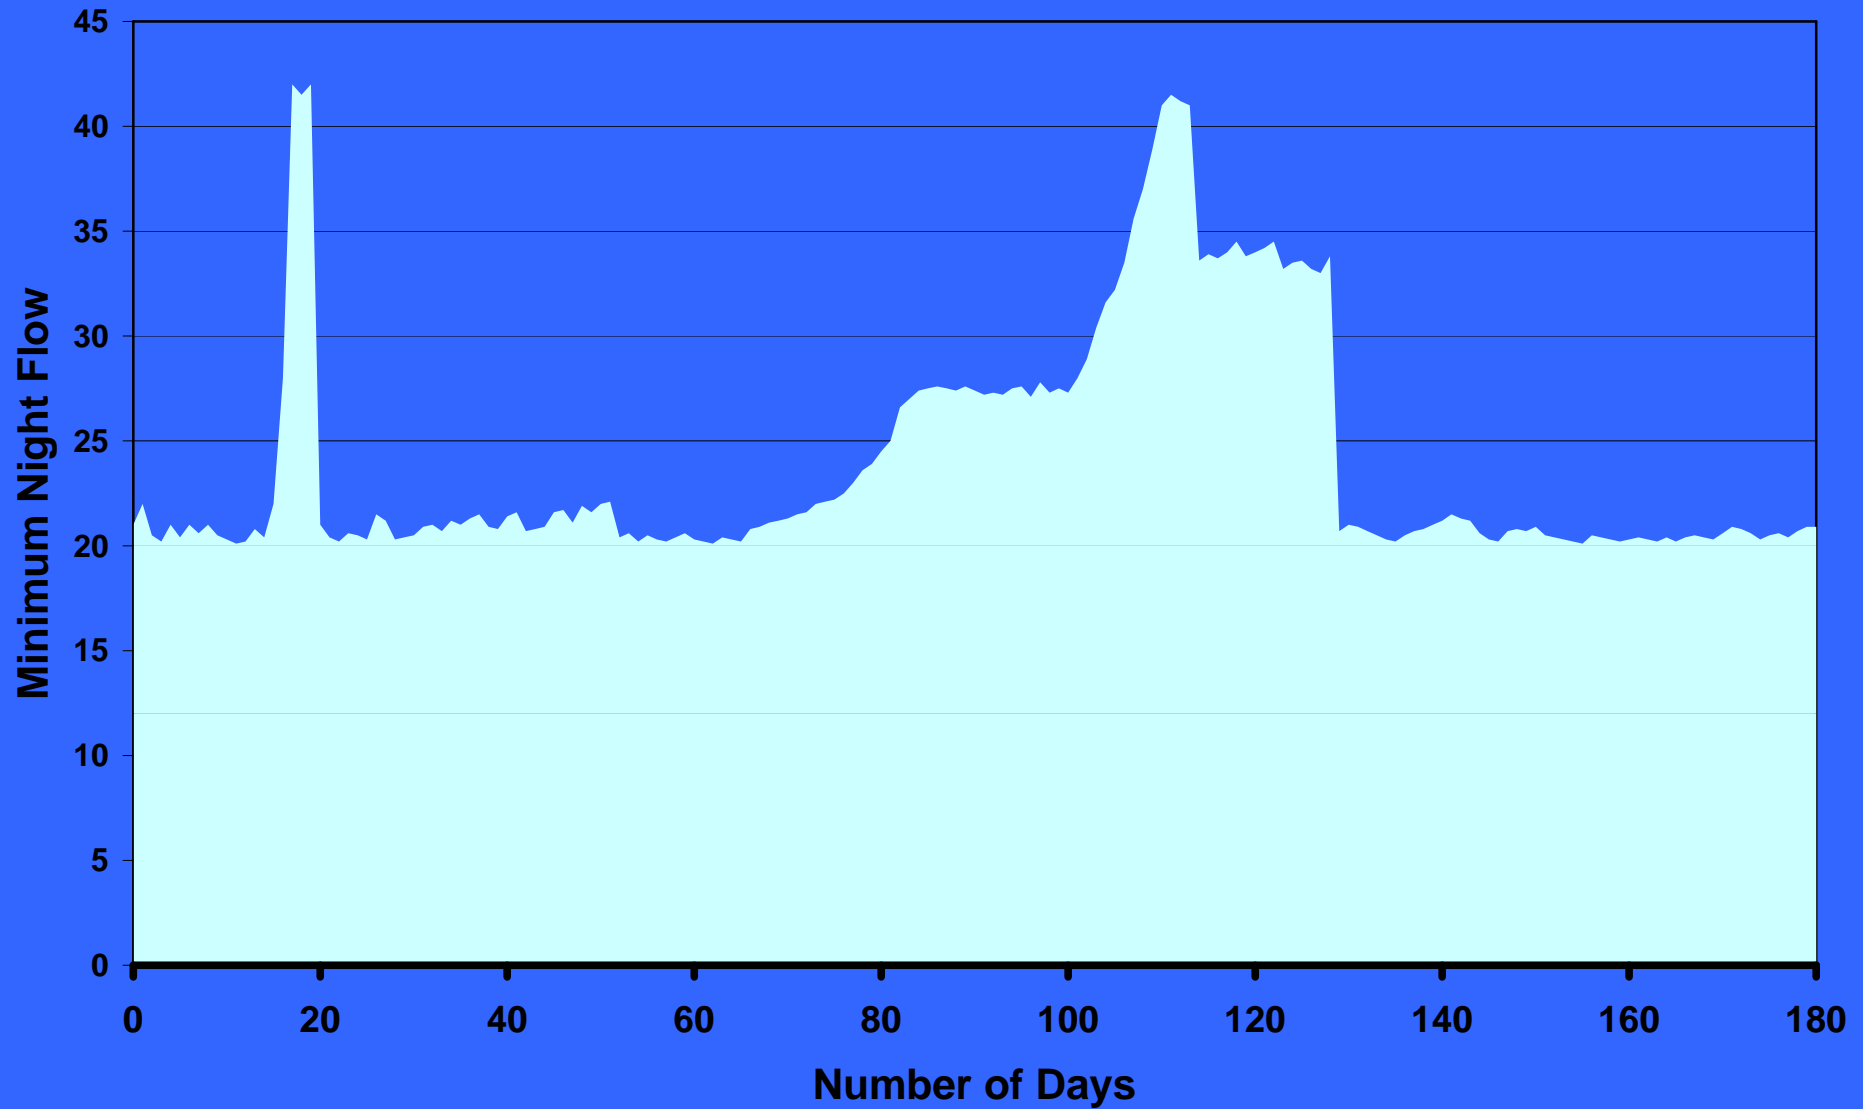

# Data Analysis

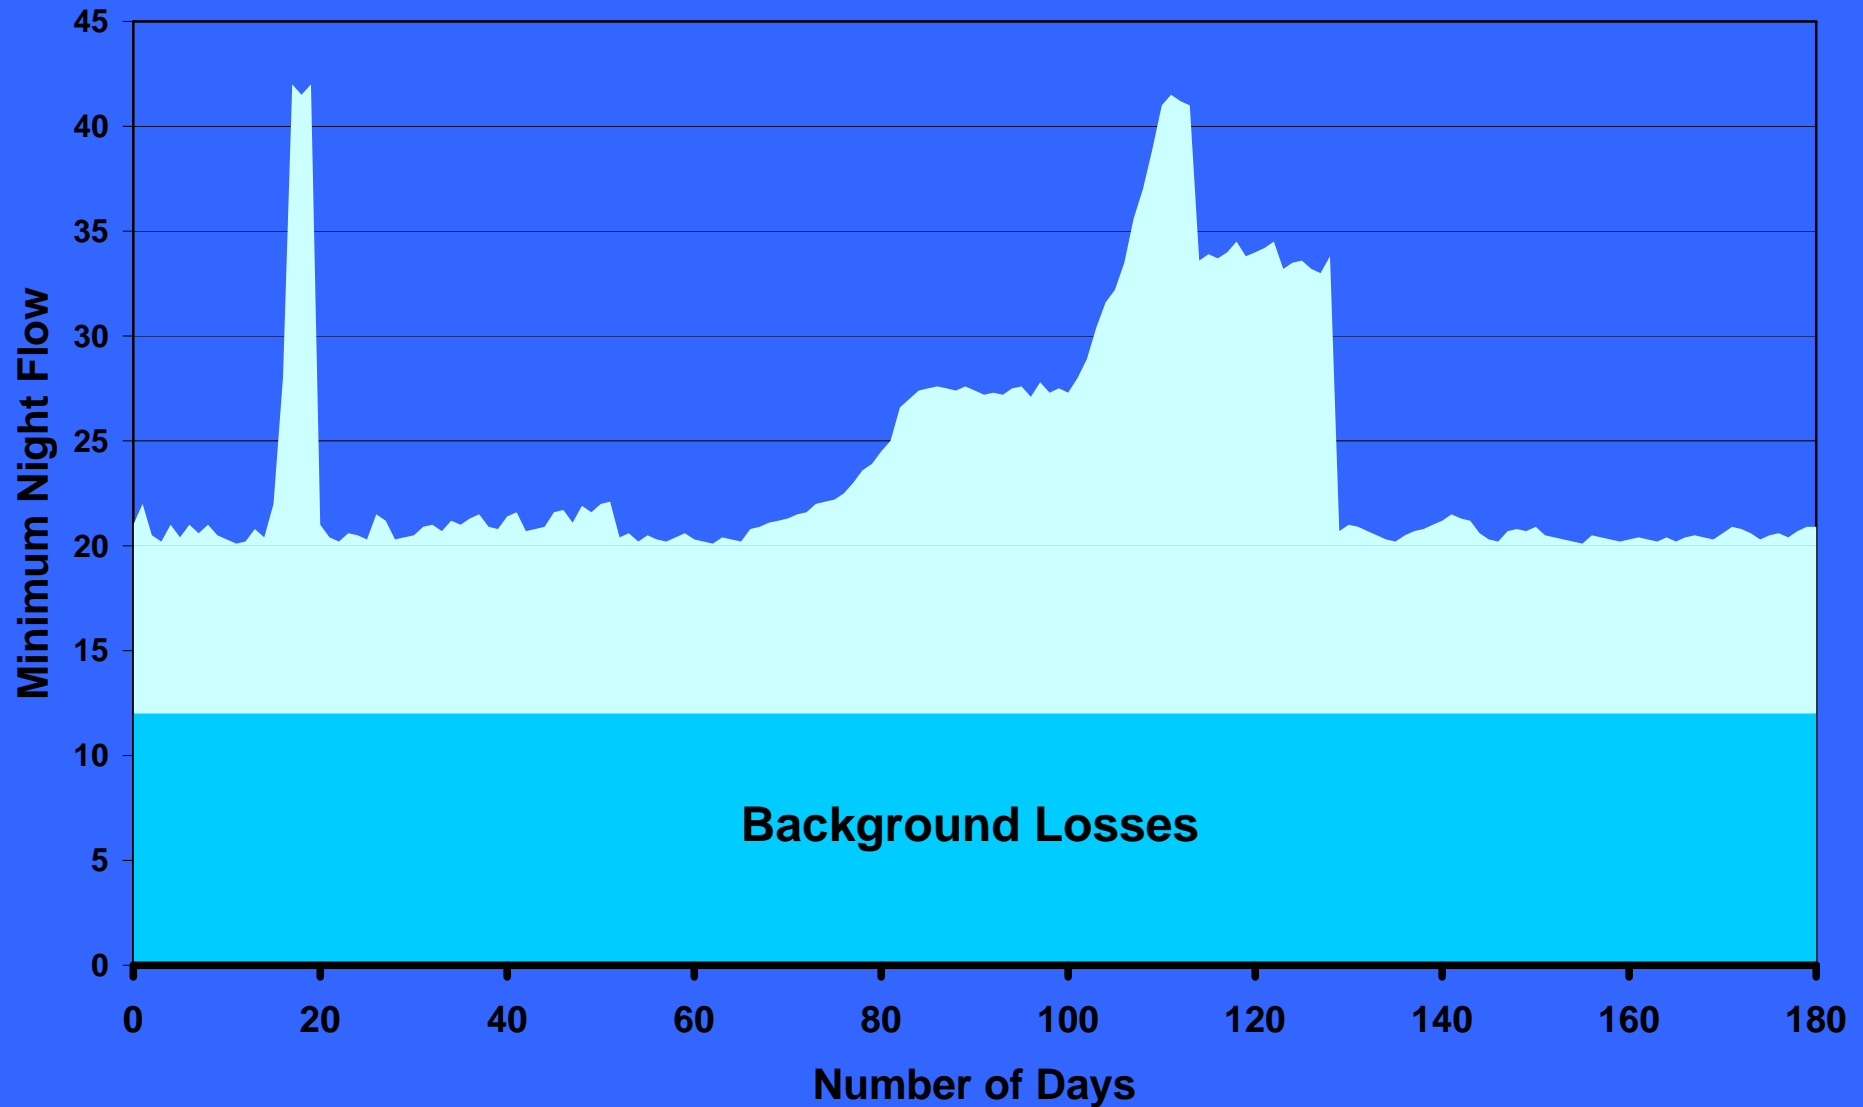

## After Leak Detection and Repair

# Using DMA Night Flow Data

# Using DMA Night Flow Data

# Using DMA Night Flow Data

# Implementing a DMA Program

- ◆ **Conditions for successful DMA program implementation:**
  - **System knowledge - mapping may be necessary**
  - **Equipment: flow and pressure measuring and recording devices**
  - **Expert capacity to design DMAs, set up the process, train staff and interpret data**
- ◆ **Sustained commitment and support from management and staff**
- ◆ **DMA Program can be implemented in stages**

# Special Strategies for Intermittent Supply Situation

- 💧 DMA approach also useful for intermittent flow conditions
- 💧 Measurements during fully pressurized conditions yields information on leakage volume and location
- 💧 However, night flow monitoring not that straight forward (filling of tanks)
- 💧 Longer term strategy: gradually convert to continuous supply over time, DMA by DMA
- 💧 Continuous supply has many other benefits

# Leakage and Bursts are related to Pressure

- 💧 Excessive pressure is a major source of leakage and bursts
- 💧 Managing pressure in low pressure systems likewise beneficial
- 💧 Reducing pressure has direct impact on existing leaks with immediate results

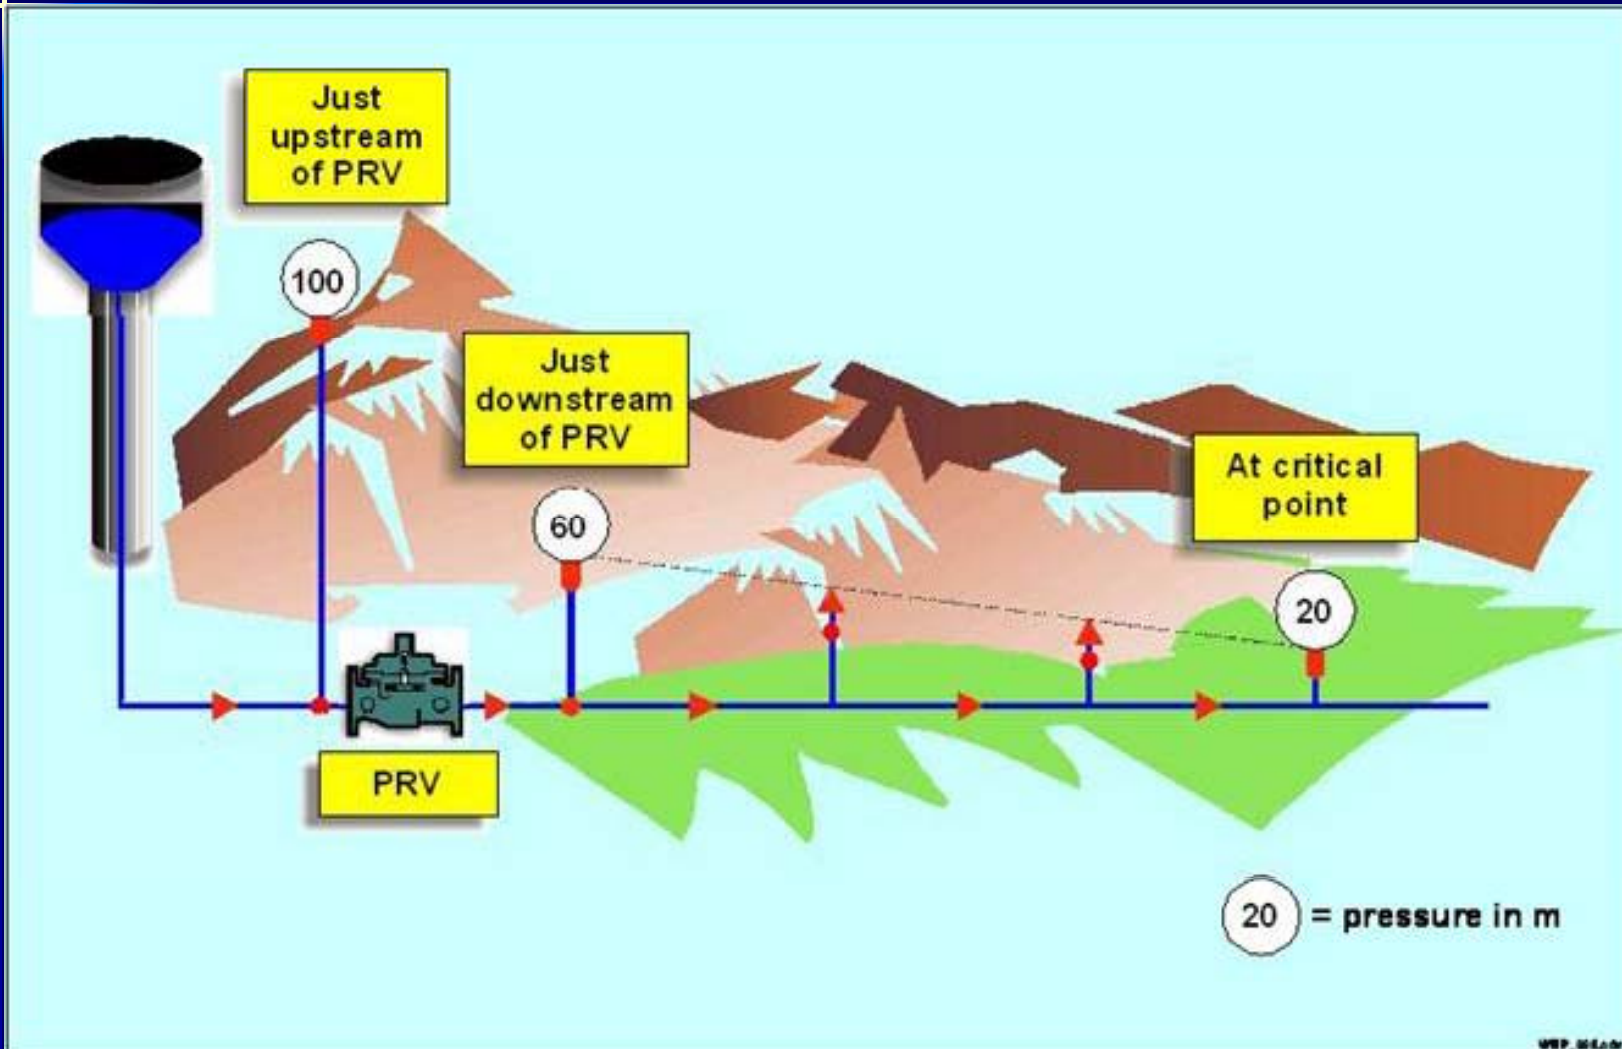

# Ways of Reducing Network Pressure

- 💧 Zoning by elevation
- 💧 Throttled gate valves (not recommended, due to wear on the gate and poor control)
- 💧 Pump control --- variable speed drive
- 💧 Pressure Reducing Valves (PRVs), the most common method today

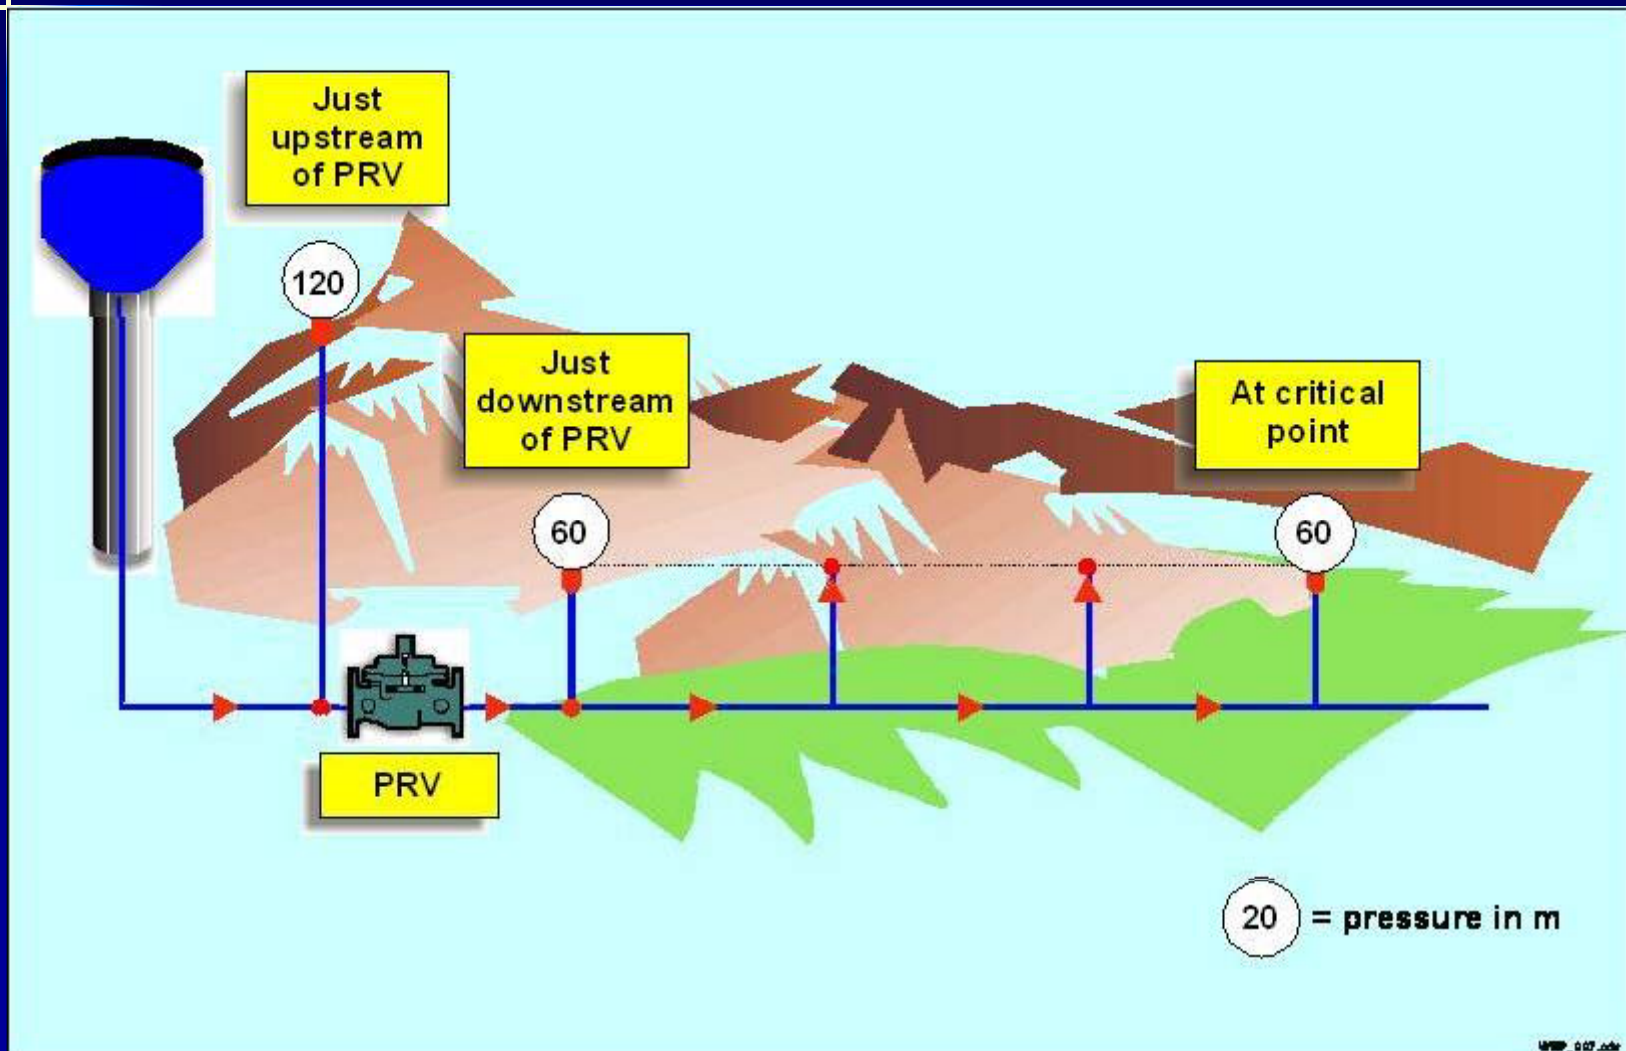

# Typical Installation Arrangements

# Pressure Variations During Peak Demand Periods

# Pressure Variations During Low Demand Periods

# Flow Modulated PRV Control: Keep Pressure at Critical Point Constant

# Assessing, Preparing for Pressure Management by Zones

- 💧 Identification of potential zones based on hydraulic modelling or pressure mapping
- 💧 Demand, customer analysis
- 💧 Pressure standards
- 💧 Hydraulic modelling to assess effects of pressure reduction on flow/ pressure regime
- 💧 Cost/benefit analysis comparing PRV installation with other possible solutions
- 💧 Specification (sizing) of PRV (important!!!)

## Even in Low Pressure Situations, Pressure Management is Beneficial

- 💧 Normally not done – PRVs were traditionally installed to reduce **excessively high** pressures; but: pressure management also beneficial in low pressure situations
- 💧 10 psi pressure: a 2 psi pressure increase results in about 20% more leakage!!
- 💧 In poor quality networks pressure increases caused by leak repair might compensate all savings!

# Example: Capping of Night Time Pressure

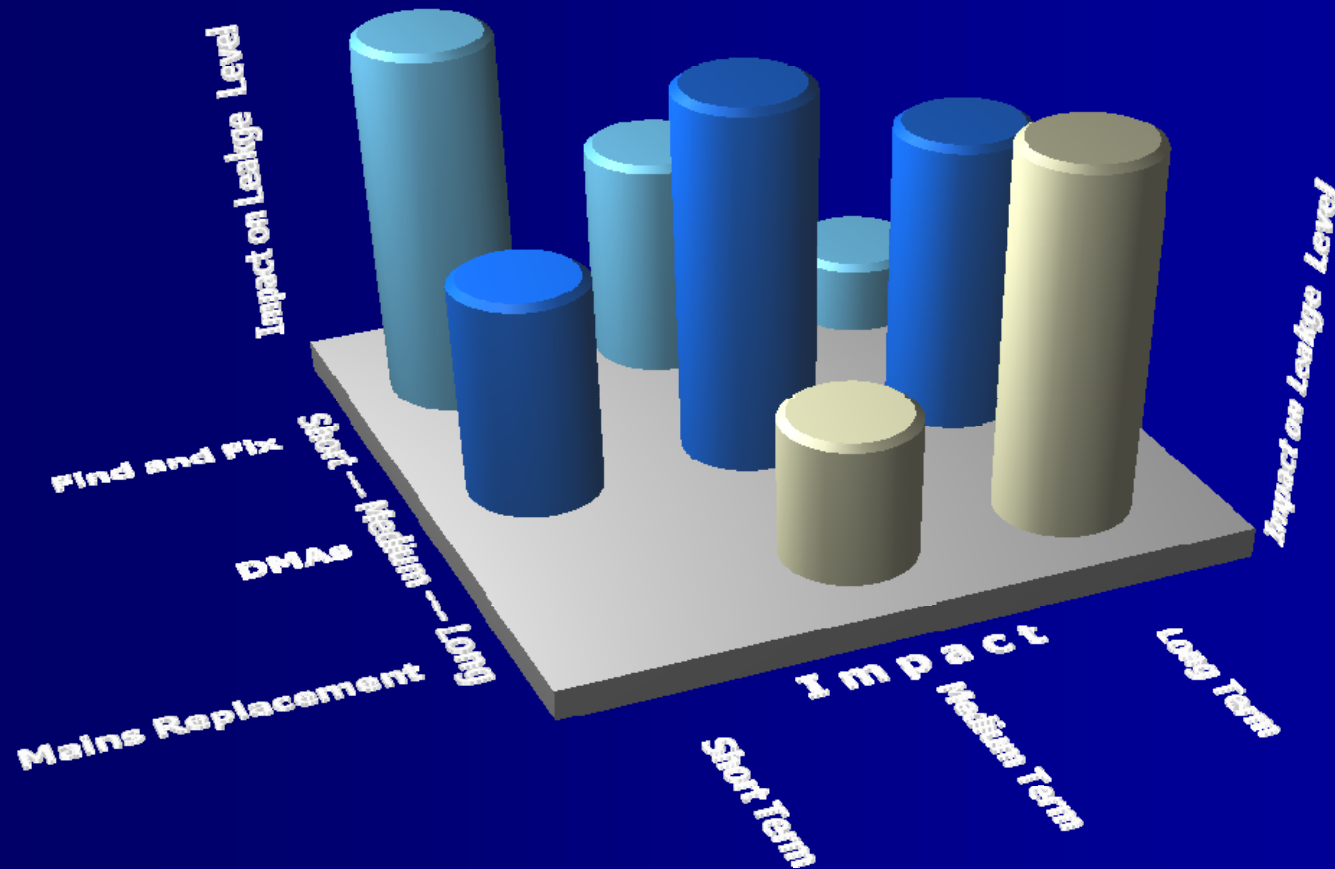

Area: 1  
Inflow Analysis - Day 1

# Key Questions: Repair, Replacement, or Doing Nothing?

- 🔹 **Objective: tackle leaks in a most cost-effective way**
- 🔹 **Choices/Decisions**
  - **Repair or replace or rehabilitate or doing nothing?**
  - **Repair or reducing pressure, or both?**
  - **Where to start ?**
  - **How to set priorities?**
  - **What materials to be use?**
  - **Replace as is or in view of future extensions?**
  - **Operations improvements?**

# Short-Medium-Long Term Action → Short-Medium-Long Term Impact

# Approach for Utilities with Limited Data and Analytical Capacity

- 💧 **Sophisticated approaches not necessary for many utilities initially; most likely**
  - most leakage is way above the economic level and reduction could start immediately
  - savings from leakage reduction the cheapest next source
- 💧 **Phased approach:**
  - prepare, lay the ground for the future
  - **begin action on the ground immediately**

# How to Begin?

## Prepare, plan for the future

- 💧 **Begin to understand**
  - calculate water balance
  - initiate bottom-up leakage assessment
- 💧 **Begin data collection, mapping**
- 💧 **Think about DMAs**
- 💧 **Vision with objectives and targets**
- 💧 **Install bulk meters**
- 💧 **Generate support and commitment**
- 💧 **Assess and build capacity**
- 💧 **Consider options for outsourcing**

# How to begin? Some Inexpensive Suggestions for Immediate Actions

- 💧 **Locate and repair visible leaks!**
- 💧 **Improve response time and capacity to repair**
- 💧 **Repair, replace leaking pipes, connections based on common sense judgement:**
  - **age of pipe alone is NOT a criterion for replacement, but burst frequency may be**
  - **leaking service connections shall generally be replaced**
- 💧 **Initiate DMAs and pressure management**

# Specialized Knowledge and Skills Required

- 💧 **Good analysis requires expertise and experience**
- 💧 **Much information is available, being developed**
  - **technical groups (IWA) working on manuals**
  - **many published articles, case studies**
  - **computer programs**
- 💧 **BUT, most utilities don't have capacity**
- 💧 **Seek assistance from consultants with track record**

## Conclusion/ Key messages

- 💧 Reducing water losses is a complex, never ending challenge **with the certainty of great benefits**
- 💧 It is essential for improving service provision and operating efficiency of utilities, particularly those in the developing world
- 💧 Expert knowledge needed for efficient and effective implementation
